(54) Title: ALPHA-KETOAMIDE INHIBITORS OF HEPATITIS C VIRUS NS3 PROTEASE

(57) Abstract: The present invention relates to ketoamide and ketoester compounds of Formula (I): where W is -NH- or -O-, or stereoisomeric forms, stereoisomeric mixtures, or pharmaceutically acceptable salt forms thereof, which are useful as inhibitors of HCV NS3 protease, and to pharmaceutical compositions and diagnostic kits comprising the same, and methods of using the

same for treating viral infection or as an assay standard or reagent.

5

TITLE

Alpha-Ketoamide Inhibitors of Hepatitis C Virus NS3
Protease

FIELD OF THE INVENTION

The present invention relates generally to a novel
10 class of alpha-ketoamides which are useful as serine
protease inhibitors, and more particularly as Hepatitis
C virus NS3 protease inhibitors. This invention also
relates to pharmaceutical compositions comprising these
compounds and methods of using the same.

15

BACKGROUND OF THE INVENTION

Hepatitis C virus (HCV) is the major cause of
transfusion and community-acquired non-A, non-B
hepatitis worldwide. Approximately 2% of the world's
population are infected with the virus. In the Unites
20 States, hepatitis C represents approximately 20% of
cases of acute hepatitis. Unfortunately, self-limited
hepatitis is not the most common course of acute HCV
infection. In the majority of patients, symptoms of
acute hepatitis resolve, but alanine aminotransferase (a
25 liver enzyme diagnostic for liver damage) levels often
remain elevated and HCV RNA persists. Indeed, a
propensity to chronicity is the most distinguishing
characteristic of hepatitis C, occurring in at least 85%
of patients with acute HCV infection. The factors that
30 lead to chronicity in hepatitis C are not well defined.
Chronic HCV infection is associated with increased
incidence of liver cirrhosis and liver cancer. No
vaccines are available for this virus, and current
treatment is restricted to the use of alpha interferon,
35 which is effective in only 15-20% of patients. Recent
clinical studies have shown that combination therapy of
alpha interferon and ribavirin leads to sustained

5 efficacy in 40% of patients (Poynard, T. et al. *Lancet*
1998, 352, 1426-1432.). However, a majority of patients
still either fail to respond or relapse after completion
of therapy. Thus, there is a clear need to develop more
effective therapeutics for treatment of HCV-associated
10 hepatitis.

HCV is a positive-stranded RNA virus. Based on
comparison of deduced amino acid sequence and the
extensive similarity in the 5' untranslated region, HCV
has been classified as a separate genus in the
15 Flaviviridae family, which also includes flaviviruses
such as yellow fever virus and animal pestiviruses like
bovine viral diarrhea virus and swine fever virus. All
members of the Flaviviridae family have enveloped
virions that contain a positive stranded RNA genome
20 encoding all known virus-specific proteins via
translation of a single, uninterrupted, open reading
frame.

Considerable heterogeneity is found within the
nucleotide and encoded amino acid sequence throughout
25 the HCV genome. At least six major genotypes have been
characterized, and more than 50 subtypes have been
described. The major genotypes of HCV differ in their
distribution worldwide, and the clinical significance of
the genetic heterogeneity of HCV remains elusive despite
30 numerous studies of the possible effect of genotypes on
pathogenesis and therapy.

The RNA genome is about 9.6 Kb in length, and
encodes a single polypeptide of about 3000 amino acids.
The 5' untranslated region contains an internal ribosome
35 entry site (IRES), which directs cellular ribosomes to
the correct AUG for initiation of translation. As was
determined by transient expression of cloned HCV cDNAs,
the precursor protein is cotranslationally and
posttranslationally processed into at least 10 viral

5 structural and nonstructural (NS) proteins by the action of a host signal peptidase and by two distinct viral proteinase activities. The translated product contains the following proteins: core-E1-E2-p7-NS2-NS3-NS4A-NS4B-NS5A-NS5B.

10 The N-terminal portion of NS3 functions as a proteolytic enzyme that is responsible for the cleavage of sites liberating the nonstructural proteins NS4A, NS4B, NS5A, and NS5B. NS3 has further been shown to be a serine protease. Although the functions of the NS
15 proteins are not completely defined, it is known that NS4A is a protease cofactor and NS5B is an RNA polymerase involved in viral replication. Thus agents that inhibit NS3 proteolytic processing of the viral polyprotein are expected to have antiviral activity.

20 There are several patents which disclose HCV NS3 protease inhibitors. WO98/17679 describes peptide and peptidomimetic inhibitors with the following formula: U-E⁸-E⁷-E⁶-E⁵-E⁴-NH-CH(CH₂G¹)-W¹, where W is one of a variety of electrophilic groups, including boronic acid
25 or ester. E⁴ represents either an amino acid or one of a series of peptidomimetic groups, the synthesis of which are not exemplified. HCV protease inhibitors described in the present case are not covered.

Based on the large number of persons currently
30 infected with HCV and the limited treatments available, it is desirable to discover new inhibitors of HCV NS3 protease.

SUMMARY OF THE INVENTION

Accordingly, one object of the present invention is
35 to provide novel HCV NS3 protease inhibitors.

It is another object of the present invention to provide a novel method of treating HCV infection which comprises administering to a host in need of such

5 treatment a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt form thereof.

It is another object of the present invention to provide pharmaceutical compositions with HCV NS3
 10 protease inhibiting activity comprising a pharmaceutically acceptable carrier and a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt form thereof.

15 It is another object of the present invention to provide a method of inhibiting HCV present in a body fluid sample which comprises treating the body fluid sample with an effective amount of a compound of the present invention.

20 It is another object of the present invention to provide a kit or container containing at least one of the compounds of the present invention in an amount effective for use as a standard or reagent in a test or assay for determining the ability of a potential
 25 pharmaceutical to inhibit HCV NS3 protease, HCV growth, or both.

It is another object of the present invention to provide novel compounds for use in therapy.

It is another object of the present invention to
 30 provide the use of novel compounds for the manufacture of a medicament for the treatment of HCV.

20 DEFINITIONS

The compounds herein described have asymmetric
centers. Compounds of the present invention containing
an asymmetrically substituted atom may be isolated in
optically active or racemic forms. It is well known in
25 the art how to prepare optically active forms, such as
by resolution of racemic forms or by synthesis from
optically active starting materials. Geometric isomers
of double bonds such as olefins and C=N double bonds can
also be present in the compounds described herein, and
30 all such stable isomers are contemplated in the present
invention. Cis and trans geometric isomers of the
compounds of the present invention are described and may
be isolated as a mixture of isomers or as separated
isomeric forms. All chiral, diastereomeric, racemic
35 forms and all geometric isomeric forms of a structure
are intended, unless the specific stereochemistry or
isomeric form is specifically indicated. All processes
used to prepare compounds of the present invention and

5 intermediates made therein are considered to be part of the present invention.

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group,
10 provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. When
15 a ring system (e.g., carbocyclic or heterocyclic) is said to be substituted with a carbonyl group or a double bond, it is intended that the carbonyl group or double bond be part (i.e., within) of the ring.

The present invention is intended to include all
20 isotopes of atoms occurring in the present compounds. Isotopes include those atoms having the same atomic number but different mass numbers. By way of general example and without limitation, isotopes of hydrogen include tritium and deuterium. Isotopes of carbon
25 include C-13 and C-14.

When any variable (e.g., R^{1a}) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for
30 example, if a group is shown to be substituted with 0-3 R^{1a}, then said group may optionally be substituted with up to three R^{1a} groups and R^{1a} at each occurrence is selected independently from the definition of R^{1a}. Also, combinations of substituents and/or variables are
35 permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When

5 a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents and/or variables are
10 permissible only if such combinations result in stable compounds.

As used herein, "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number
15 of carbon atoms. For example, "C₁-C₁₀ alkyl" (or alkylene), is intended to include C₁, C₂, C₃, C₄, C₅, C₆, C₇, C₈, C₉, and C₁₀ alkyl groups. Additionally, for example, "C₁-C₆ alkyl" denotes alkyl having 1 to 6 carbon atoms. Examples of alkyl include, but are not

"Alkenyl" or "alkenylene" is intended to include
25 hydrocarbon chains of either a straight or branched configuration having the specified number of carbon atoms and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain. For example, "C₂-C₆ alkenyl" (or alkenylene), is

35 methyl-3-pentenyl, and the like.

"Alkynyl" or "alkynylene" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more carbon-carbon triple bonds which may occur in any stable point along the chain.

5 For example, "C₂-C₆ alkynyl" (or alkynylene), is intended to include C₂, C₃, C₄, C₅, and C₆ alkynyl groups; such as ethynyl, propynyl, butynyl, pentynyl, hexynyl and the like.

"Cycloalkyl" is intended to include saturated ring
10 groups, having the specified number of carbon atoms. For example, "C₃-C₆ cycloalkyl" denotes such as cyclopropyl, cyclobutyl, cyclopentyl, or cyclohexyl.

"Alkoxy" or "alkyloxy" represents an alkyl group as defined above with the indicated number of carbon atoms
15 attached through an oxygen bridge. For example, "C₁-C₆ alkoxy" (or alkyloxy), is intended to include C₁, C₂, C₃, C₄, C₅, and C₆ alkoxy groups. Examples of alkoxy include, but are not limited to, methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, s-butoxy, t-butoxy,

"Halo" or "halogen" as used herein refers to
25 fluoro, chloro, bromo, and iodo; and "counterion" is used to represent a small, negatively charged species such as chloride, bromide, hydroxide, acetate, sulfate, and the like.

"Haloalkyl" is intended to include both branched
30 and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, substituted with 1 or more halogen (for example -C_vF_w where v = 1 to 3 and w = 1 to (2v+1)). Examples of haloalkyl include, but are not limited to,

- 5 aliphatic hydrocarbon groups having the specified number of carbon atoms, substituted with 1 or more fluorine atoms.

As used herein, "carbocycle" is intended to mean any stable 3, 4, 5, 6, or 7-membered monocyclic or
10 bicyclic or 7, 8, 9, 10, 11, 12, or 13-membered bicyclic or tricyclic, any of which may be saturated, partially unsaturated, or aromatic. Examples of such carbocycles include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl,
15 adamantyl, cyclooctyl, [3.3.0]bicyclooctane, [4.3.0]bicyclonona, [4.4.0]bicyclodecane (decalin), [2.2.2]bicyclooctane, fluorenyl, phenyl, naphthyl, indanyl, adamantyl, or tetrahydronaphthyl (tetralin).

As used herein, the term "heterocycle" or
20 "heterocyclic group" is intended to mean a stable 5, 6, or 7-membered monocyclic or bicyclic or 7, 8, 9, 10, 11, 12, 13, or 14-membered bicyclic heterocyclic ring which is saturated partially unsaturated or unsaturated (ie. aromatic or "heteroaryl"), and which consists of
25 carbon atoms and 1, 2, 3 or 4 heteroatoms independently selected from the group consisting of N, O and S; and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The nitrogen and sulfur heteroatoms may
30 optionally be oxidized to -NO-, -SO-, or -SO₂-. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen

"Amino acids residue" also refers to various amino acids where sidechain functional groups are coupled with appropriate protecting groups known to those skilled in the art. "The Peptides", Vol 3, 3-88 (1981)discloses
15 numerous suitable protecting groups and is incorporated herein by reference for that purpose. Examples of amino acids where sidechain functional groups are coupled with appropriate protecting groups include, but are not limited to, Asp(OMe), Glu(OMe), Hyp(OMe), Asp(O^tBu),
20 Glu(O^tBu), Hyp(O^tBu), Thr(O^tBu), Asp(OBzl), Glu(OBzl), Hyp(OBzl), and Thr(OBzl).

The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials,
25 compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate
30 with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable
35 salts include, but are not limited to, mineral or organic acid salts of basic groups such as amines; and alkali or organic salts of acidic groups such as carboxylic acids. The pharmaceutically acceptable salts include the conventional non-toxic salts or the

5 quaternary ammonium salts of the parent compound formed,
for example, from non-toxic inorganic or organic acids.
For example, such conventional non-toxic salts include
those derived from inorganic acids such as hydrochloric,
hydrobromic, sulfuric, sulfamic, phosphoric, and nitric;
10 and the salts prepared from organic acids such as
acetic, propionic, succinic, glycolic, stearic, lactic,
malic, tartaric, citric, ascorbic, pamoic, maleic,
hydroxymaleic, phenylacetic, glutamic, benzoic,
salicylic, sulfanilic, 2-acetoxybenzoic, fumaric,
15 toluenesulfonic, methanesulfonic, ethane disulfonic,
oxalic, and isethionic.

The pharmaceutically acceptable salts of the
present invention can be synthesized from the parent
compound which contains a basic or acidic moiety by
20 conventional chemical methods. Generally, such salts
can be prepared by reacting the free acid or base forms
of these compounds with a stoichiometric amount of the
appropriate base or acid in water or in an organic
solvent, or in a mixture of the two; generally,
25 nonaqueous media like ether, ethyl acetate, ethanol,
isopropanol, or acetonitrile are preferred. Lists of
suitable salts are found in *Remington's Pharmaceutical
Sciences*, 17th ed., Mack Publishing Company, Easton, PA,
1985, p. 1418, the disclosure of which is hereby
30 incorporated by reference.

Since prodrugs are known to enhance numerous
desirable qualities of pharmaceuticals (e.g.,
solubility, bioavailability, manufacturing, etc.) the
compounds of the present invention may be delivered in
35 prodrug form. Thus, the present invention is intended
to cover prodrugs of the presently claimed compounds,
methods of delivering the same and compositions
containing the same. "Prodrugs" are intended to include
any covalently bonded carriers which release an active

5 parent drug of the present invention *in vivo* when such
prodrug is administered to a mammalian subject.
Prodrugs of the present invention are prepared by
modifying functional groups present in the compound in
such a way that the modifications are cleaved, either in
10 routine manipulation or *in vivo*, to the parent compound.
Prodrugs include compounds of the present invention
wherein a hydroxy, amino, or sulfhydryl group is bonded
to any group that, when the prodrug of the present
invention is administered to a mammalian subject, it
15 cleaves to form a free hydroxyl, free amino, or free
sulfhydryl group, respectively. Examples of prodrugs
include, but are not limited to, acetate, formate and
benzoate derivatives of alcohol and amine functional
groups in the compounds of the present invention.

20 "Stable compound" and "stable structure" are meant
to indicate a compound that is sufficiently robust to
survive isolation to a useful degree of purity from a
reaction mixture, and formulation into an efficacious
therapeutic agent.

25 "Therapeutically effective amount" is intended to
include an amount of a compound of the present invention
or an amount of the combination of compounds claimed
effective to inhibit HCV infection or treat the symptoms
of HCV infection in a host. The combination of
30 compounds is preferably a synergistic combination.
Synergy, as described for example by Chou and Talalay,
Adv. Enzyme Regul. 1984, 22, 27-55, occurs when the
effect (in this case, inhibition of the desired target)
of the compounds when administered in combination is
35 greater than the additive effect of the compounds when
administered alone as a single agent. In general, a
synergistic effect is most clearly demonstrated at
suboptimal concentrations of the compounds. Synergy can
be in terms of lower cytotoxicity, increased antiviral

5 effect, or some other beneficial effect of the
combination compared with the individual components.

SYNTHESIS

10 The compounds of the present invention can be
prepared in a number of ways well known to one skilled
in the art of organic synthesis. The compounds of the
present invention can be synthesized using the methods
described below, together with synthetic methods known
15 in the art of synthetic organic chemistry, or variations
thereon as appreciated by those skilled in the art.
Preferred methods include, but are not limited to, those
described below. All references cited herein are hereby
incorporated in their entirety herein by reference.

20 The novel compounds of this invention may be
prepared using the reactions and techniques described in
this section. The reactions are performed in solvents
appropriate to the reagents and materials employed and
are suitable for the transformations being effected.
25 Also, in the description of the synthetic methods
described below, it is to be understood that all
proposed reaction conditions, including choice of
solvent, reaction atmosphere, reaction temperature,
duration of the experiment and workup procedures, are
30 chosen to be the conditions standard for that reaction,
which should be readily recognized by one skilled in the
art. It is understood by one skilled in the art of
organic synthesis that the functionality present on
various portions of the molecule must be compatible with
35 the reagents and reactions proposed. Such restrictions
to the substituents which are compatible with the
reaction conditions will be readily apparent to one
skilled in the art and alternate methods must then be
used.

Many of the CBZ protected amino acids and amino acid methyl esters are commercially available or may be prepared from commercial amino acid derivatives by simple protecting group manipulations. Others may be synthesized in racemic form using the Strecker synthesis or amidomalonate synthesis. In addition, the Myers pseudoephedrine glycinamide alkylation method (Myers, A. G.; Gleason, J. L.; Yoon, T; Kung, D. W.. *J. Am. Chem. Soc.* **1997**, *119*, 656-673) and the Evans electrophilic azidation (Evans, D. A.; Britton, T. C.; Ellman, J. A.; Dorow, R. L. *J. Am. Chem. Soc.* **1990**, *112*, 4011) may be used to prepare unnatural amino acids in enantiomerically pure form.

 resolution using a resolving agent such as camphonic
 chloride as in Steven D. Young, et al, *Antimicrobial
 Agents and Chemotherapy* 1995, 2602-2605. A chiral

Example A1

N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-cyclohexyl-L-alanyl-2-oxo-(3 S)-3-amino pentanoylglycine

Step (A1a): At 0°C, DIEA (12.1Ml, 69.5 mmol) was added
25 to the suspension of $\text{Ph}_3\text{PCH}_2\text{CNCI}$ in CH_2Cl_2 . The
 suspension turned to clear. The aminobutyric acid
 (15.0g, 63.2 mmol) was added followed by addition of
 EDCI (12.7g, 66.4 mmol) and DMAP (0.77g, 6.32 mmol).
 The resulted mixture was stirred at 0°C for 2h and at rt
30 over night. Most of the solvent was evaporated and the
 residue was chromatographed on silica gel (50-60%
 EtOAc:Hexane). The product (Scheme 1, 2) was obtained
 as a white solid 22.7g in 69% yield. MS found (M+1)⁺
 521.3

35

Step (A1b): The ylide obtained from Step(A1a) (10g,
19.2 mmol) was dissolved in CH_2Cl_2 (200 mL) and the
mixture was cooled to -78°C. To this mixture at -78°C
was purged O_3 until the color changed to blue. Excess

5 O₃ was removed by purging N₂ into the mixture. The solution of Gly-OtBu hydrochloride (3.54g, 21.1 mmol), pretreated with DIEA and precooled) in CH₂Cl₂ was added at -78°C to the above reaction mixture and stirred at -78°C for 30 min, then warmed to rt. Solvent was
10 evaporated and the residue was chromatographed on silica gel (20-50% EtOAc:hexane). The α -ketoamide (Scheme 1, 3) was obtained in 58% yield as an oil (4.25g). MS found (M+Na)⁺ 401.1. Similarly, the reaction mixture can be quenched with methanol instead of Gly-OtBu to
15 provide the corresponding α -ketoester (Scheme 1, 3a).

Step (A1c): To a solution of ketoamide obtained from Step (A1b) (0.23g, 0.61 mmol) in THF (10 mL) at 0°C was added sodium borohydride (42mg, 1.22mmol) in portions.
20 After stirring at 0°C for 30 min, the reaction mixture was quenched with acetone. Most of the solvent was evaporated and the residue was dissolved in EtOAc, washed with H₂O and brine. Chromatography on silica gel (40% EtOAc in hexane) yielded 124 mg α -hydroxyamide
25 (Scheme 1, 4) as a colorless oil (53%). MS found (M+1)⁺ 381.2.

Step (A1d): The α -hydroxyamide obtained from Step (A1c) (124 mg, 0.326 mmol) was dissolved in MeOH (50 mL) and
30 Pd/C 10mg) was added. The mixture was hydrogenated under 1 atm. for 40 min. The reaction mixture was filtered and concentrated. The amine (Scheme 1, 5) was obtained in 99% yield as a white solid 82 mg. MS found (M+1)⁺ 247.3. Similarly, the α -ketoester from (A1b) was
35 converted to α -hydroxyester (Scheme 1, 5a) via step (A1c).

5 Step (A1e): DCC (3.99g, 19.3 mmol, 1.2 eq) was added to
a solution of 2-pyrazine carboxylic acid (2.0g, 16.1
mmol) and N-hydroxysuccinimide (1.95g, 16.9 mmol,
1.05eq) in 100mL THF at 0°C. The mixture was stirred at
rt over night. The reaction mixture was filtered,
10 concentrated and dried. The product was obtained in 91%
yield as a solid (Scheme 4, 17).

Step (A1f): At 0°C under N₂, DIEA (13.3mL, 76.13 mmol)
was added to a solution of material from Step (A1e)
15 (10g, 45.2 mmol) and leucine (5.93g, 45.3 mmol) in 120
mL DMF. After addition, the resulted mixture was
stirred at rt over night. The mixture was diluted with
200 mL of EtOAc, washed with 1N HCl (2x30 mL), H₂O (2x50
mL) and brine, and dried over MgSO₄. The solvent was
20 removed and dried on vacuum to provide a white solid as
pure product (95%) (Scheme 4, 19). MS found (M-1)-
219.

Step (A1g): Following a procedure analogous to Step

providing the desired product as a white solid (1.28g,
90%) (Scheme 4, 20).

30 Step (A1h): Following a procedure analogous to Step
(A1f), the succinimide ester of N-Boc isoleucine (10g,
30.45 mmol) was treated with cyclohexylalanine (6.32g,
30.45 mmol) in the presence of DIEA in DMF, providing

20 N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-
cyclohexyl-L-alanyl-5,5-difluoro-2-oxo-(3S)-3-
aminopentanoylglycine

- 25 Step (A50a): To a suspension of KOtBu (3.55g, 31.7mmol)
in 15mL CH₂Cl₂ was added N-CBZ-phosphonolycine trimethyl
ester (9.46g, 28.5mmol) at -78°C under N₂. This mixture
was stirred for 15min at this temperature and 2,2-
difluoroacetaldehyde ethyl hemiacetal (4.0g, 31.7mmol)
30 was added slowly. The resulted mixture was warmed up to
room temperature and stirred overnight. Most solvent was
removed and the residue was dissolved in ethyl acetate.
The mixture was washed with cold water, dried over
magnesium sulfate and concentrated. Flash
35 chromatography (10-15% EtOAc/Hexane) gave the desired
alkene (1.97g, 24%) (Scheme 3, **11**) as a clear oil (4:1
mixture of Z:E isomers). (M+1)⁺ 286.3.

5 Step (A50b): A mixture the material from Step (A50a)
(0.90g, 3.16mmol) and of (+)-1,2-bis((2S,5S)-2,5-
diethyl-phospholano)benzene-(cyclooctadiene)rhodium(I)
trifluoromethanesulfonate ([Rh(COD)(S,S-di-Ethyl-
DUPHOS)]⁺CF₃SO₃⁻) (25mg, 0.03mmol, 1 mol%) in 20mL MeOH
10 was hydrogenated at 50psi for 15h. After evaporation of
solvent, the residue was dissolved in 30% EtOAc/Hexane
and the solution was passed through a pad of silica gel
to remove trace amount of the catalyst. Evaporation of
solvent yielded the desired compound (Scheme 3, 12) as a
15 crystalline solid (0.91g, 100%).

Step (A50c): To a solution of the material from Step
(A50b) (1.95g, 5.23mmol) in 50mL CH₂Cl₂ under N₂ was
added dropwise 5.49mL DIBAL (1.0M solution in CH₂Cl₂,
20 5.49mmol) at -78°C over 15min. After stirring at this
temperature for 2h, the mixture was quenched with 10mL
5% potassium hydrogen sulfate solution. Then the
mixture was warmed up to room temperature, diluted with
CH₂Cl₂, washed with KHSO₄, NaHCO₃ and brine, dried over
25 NaSO₄ and concentrated. Flash chromatography (15-30%
EtOAc/Hexane) afforded 1.20g (89%) of the desired
aldehyde (Scheme 3, 13) as a white solid.

Step (A50d): Butyl lithium (2.5M solution in hexane,
30 4.1mL, 10.3mmol) was added dropwise to a solution of
tris(methylthio)methane (1.58g, 10.3mmol) in 20mL THF at
-64°C and the mixture was stirred at this temperature
for 20min. Then a solution of 0.66g (2.57mmol) of the
material from Step (A50c) in 5.0mL THF was added dropwise
35 to the above mixture over 10min. The resulting mixture
was stirred at -30°C and warmed up to room temperature.
Then the reaction mixture was quenched with saturated
NH₄Cl, and diluted with ethyl acetate. The organic

- 5 phase was separated and washed with 5% KHSO₄, H₂O, NaHCO₃, brine, dried over NaSO₄ and concentrated. Flash chromatography (10-15% EtOAc/Hexane) yielded 0.90g (85%) of the desired product (Scheme 3, 14) as a clear oil (a mixture of two diastereomers).
- 10 Step (A50e): To a solution of 0.15g (0.36mmol) of the material from Step (A50d) in a mixed solvent of MeOH/H₂O (12mL/1.0mL) were added 0.46g (1.69mmol) mercury(II) chloride and 0.12g (0.58mmol) mercury(II) oxide. The
- 15 resulted suspension was stirred at room temperature for 2h. Then the reaction mixture was filtered through a pad of Celite and most of the solvent was removed. The residue was dissolved in ethyl acetate, and this mixture was washed with 70% ammonium acetate, saturated ammonium
- 20 chloride, sodium bicarbonate and dilute NaCl solution, dried over magnesium sulfate and concentrated. Chromatography (30% EtOAc/Hexane) gave 0.11g (96%) of the desired product (Scheme 3, 15) as a clear oil (a mixture of two diastereomers).

The following Table 5 contains representative examples envisioned by the present invention. At the start of each table is one formula followed by species

10 **Z1** through **Z67** demonstrating the intended substitution of **Z**; species **1a** through **1bw** demonstrating the intended substitution of **R¹**; and species **9a** through **9n** demonstrating the intended substitution of **R⁹**. Each entry in each table is intended to be paired with each

15 formula at the start of the table. For example, Example 100 in Table 5 is intended to be paired with each of formulae **Z1**, **Z2**, **Z3**, **Z4**, ... through **Z67** of Table 4, as well as each of formulae **1a**, **1b**, **1c**, **1d**, ... through **1bw** of Table 4, as well as each of formulae **9a**, **9b**, **9c**, **9d**,

20 ... through **9n** of Table 4; thereby representing Example 100-9a-1a-Z1, 100-9a-1a-Z2, 100-9a-1a-Z3, ... through 243-9n-1bw-Z67.

As an illustration, Example 100-9a-1a-Z1 is N-(2-pyrazinylcarbonyl)-L-leucyl-L-isoleucyl-3-

25 cyclohexylalanyl-2-oxo-3-aminopentanoyl-N-(methylsulfonyl) glycinamide.

UTILITY

The compounds of Formula (I) are expected to inhibit the activity of Hepatitis C Virus NS3 protease. The NS3 protease inhibition is demonstrated using assays for NS3 protease activity, for example, using the assay
10 described below for assaying inhibitors of NS3 protease. The compounds of Formula (I) are expected to show activity against NS3 protease in cells, as demonstrated by the cellular assay described below. Thus, the compounds of Formula (I) are potentially useful in the
15 cure and prevention of HCV infections.

Expression and Purification of NS3 Protease

The plasmid cf1SODp600, containing the complete coding region of HCV NS3 protease, genotype 1a, was
20 obtained from ATCC (database accession: DNA Seq. Acc. M62321, originally deposited by Chiron Corporation). PCR primers were designed that allow amplification of the DNA fragment encoding the NS3 protease catalytic domain (amino acids 1 to 192) as well as its two N-terminal
25 fusions, a 5 amino acid leader sequence MGAQH (serving as a expression tag) and a 15 amino acid His tag MRGSHHHHHMGAQH. The NS3 protease constructs were cloned in the bacterial expression vector under the control of the T7 promoter and transformed in *E. coli* BL 21 (DE3)
30 cells. Expression of the NS3 protease was obtained by addition of 1 mM IPTG and cells were growing for additional 3h at 25°C. The NS3 protease constructs have several fold difference in expression level, but exhibit the same level of solubility and enzyme specific
35 activity. A typical 10 L fermentation yielded approximately 200 g of wet cell paste. The cell paste was stored at -80°C. The NS3 protease was purified based on published procedures (Steinkuhler C. et al. *Journal*

5 of *Virology* 70, 6694-6700, 1996 and Steinkuhler C. et al. *Journal of Biological Chemistry* 271, 6367-6373, 1996.) with some modifications. Briefly, the cells were resuspended in lysis buffer (10 mL/g) containing PBS buffer (20 mM sodium phosphate, pH 7.4, 140 mM NaCl),
10 50% glycerol, 10 mM DTT, 2% CHAPS and 1mM PMSF. Cell lysis was performed with use of microfluidizer. After homogenizing, DNase was added to a final concentration 70 U/mL and cell lysate was incubated at 4°C for 20 min. After centrifugation at 18,000 rpm for 30 min at 4°C
15 supernatant was applied on SP Sepharose column (Pharmacia), previously equilibrated at a flow rate 3 mL/min in buffer A (PBS buffer, 10% glycerol, 3 mM DTT). The column was extensively washed with buffer A and the protease was eluted by applying 25 column volumes of a
20 linear 0.14 - 1.0 M NaCl gradient. NS3 containing fractions were pooled and concentrated on an Amicon stirred ultrafiltration cell using a YM-10 membrane. The enzyme was further purified on 26/60 Superdex 75 column (Pharmacia), equilibrated in buffer A. The sample was
25 loaded at a flow rate 1 mL/min, the column was then washed with a buffer A at a flow rate 2 mL/min. Finally, the NS3 protease containing fractions were applied on Mono S 10/10 column (Pharmacia) equilibrated in 50 mM Tris.HCl buffer, pH 7.5, 10% glycerol and 1 mM DTT and
30 operating at flow rate 2 mL/min. Enzyme was eluted by applying 20 column volumes of a linear 0.1 - 0.5 M NaCl gradient. Based on SDS-PAGE analysis as well as HPLC analysis and active site titration, the purity of the HCV NS3 1a protease was greater than 95%. The enzyme was
35 stored at -70°C and diluted just prior to use.

Enzyme Assays

Concentrations of protease were determined in the absence of NS4a by using the peptide ester substrate Ac-

5 DED(Edans)EEAbuψ[COO]ASK(Dabcyl)-NH₂ (Taliani et al.
Anal. Biochem. 240, 60-67, 1996.) and the inhibitor, H-
Asp-Glu-Val-Val-Pro-boroAlg-OH and the inhibitor, H-Asp-
Glu-Val-Val-Pro-boroAlg-OH and by using tight binding
reaction conditions (Bieth, *Methods Enzymol.* 248, 59-85,
10 1995). Best data was obtained for an enzyme level of 50
nM. Alternately, protease (63 µg/ml) was allowed to
react with 3 µM NS4a, 0.10 mM Ac-Glu-Glu-Ala-Cys-pNA,
and varying level of H-Asp-Glu-Val-Val-Pro-boroAlg-OH
(0-6 µM). Concentrations of protease were determined
15 from linear plots of Activity vs. [inhibitor]. Molar
concentrations of proteases were determined from the x-
intercept.

K_m values were determined measuring the rate of
hydrolysis of the ester substrate over a range of
20 concentrations from 5.0 to 100 µM in the presence of 3
µM KKNS4a (KKGSVVIVGRIVLSGKPAIIPKK). Assay were run at
25°C, by incubating ~1 nM enzyme with NS4a for 5 min in
148 µl of buffer (50 mM Tri buffer, pH 7.0, 50%
glycerol, 2% Chaps, and 5.0 mM DTT. Substrate (2.0 µl)
25 in buffer was added and the reaction was allowed to
proceed for 15 min. Reactions were quenched by adding
3.0 µL of 10% TFA, and the levels of hydrolysis were
determined by HPLC. Aliquots (50 µL) were injected on
the HPLC and linear gradients from 90% water, 10%
30 acetonitrile and 0.10 % TFA to 10% water, 90%
acetonitrile and 0.10% TFA were run at a flow rate of
1.0 mL/min over a period of 30 min. HPLCs were run on a
HP1090 using a Rainin 4.6 x 250 mm C18 column (cat # 83-
201-C) fluorescent detection using 350 and 500 nm as
35 excitation and emission wavelengths, respectively.
Levels of hydrolysis were determined by measuring the
area of the fluorescent peak at 5.3 min. 100% hydrolysis

5 of a 5.0 μM sample gave an area of 7.95 ± 0.38
fluorescence units.). Kinetic constants were determined
from the iterative fit of the Michaelis equation to the
data. Results are consistent with data from Liveweaver
Burk fits and data collected for the 12.8 min peak
10 measured at 520 nm.

Enzyme activity was also measured by measuring the
increase in fluorescence with time by exciting at 355 nm
and measuring emission at 495 nm using a Perkin Elmer LS
50 spectrometer. A substrate level of 5.0 μM was used
15 for all fluorogenic assays run on the spectrometer.

Inhibitor Evaluation In vitro

Inhibitor effectiveness was determined by measuring
enzyme activity both in the presence and absence of
20 inhibitor. Velocities were fit to the equation for
competitive inhibition for individual reactions of
inhibitors with the enzyme using

$$v_i / v_o = [K_m (1 + I/K_i) + S] / [K_m + S].$$

The ratio v_i / v_o is equal to the ratio of the
25 Michaelis equations for velocities measured in the
presence (v_i) and absence (v_o) of inhibitor. Values of
 v_i / v_o were measured over a range of inhibitor
concentrations with the aid of an Excel™ Spreadsheet.
Reported K_i values are the average of 3-5 separate
30 determinations. Under the conditions of this assay, the
 IC_{50} and K_i s are comparable measures of inhibitor
effectiveness.

Using the methodology described above, compounds of
the present invention were found to exhibit K_i 's of ≤ 60
35 μM , thereby confirming the utility of the compounds of
the present invention as effective NS3 protease
inhibitors. Preferred compounds of the present invention
have K_i 's of $\leq 1 \mu\text{M}$. More preferred compounds of the

- 5 present invention have K_i 's of ≤ 100 nM. Most preferred compounds of the present invention have K_i 's of ≤ 10 nM.

Inhibitor Evaluation in Cell Assay.

- The following method was devised to assess
- 10 inhibitory action of test compounds on the HCV NS3 protease in cultured cells. Because it is not possible to efficiently infect cells with hepatitis C virus, an assay was developed based on co-expression in transfected cell lines of two plasmids, one is able to
- 15 direct synthesis of the NS3 protease and the other to provide a polypeptide analogous to a part of the HCV non-structural protein containing a single known peptide sequence highly susceptible to cleavage by the protease. When installed in cultured cells by one of a variety of
- 20 standard methods, the substrate plasmid produces a stable polypeptide of approximately 50KD, but when the plasmid coding for the viral protease is co-expressed, the enzymatic action of the protease hydrolyzes the substrate at a unique sequence between a cysteine and a
- 25 serine pair, yielding products which can be detected by antibody-based technology, eg, a western blot. Quantitation of the amounts of precursor and products can be done by scanning film auto-radiograms of the blots or direct luminescence-based emissions from the
- 30 blots in a commercial scanning device. The general organization of the two plasmids is provided in Scheme 6. The coding sequences for the NS3 protease and the substrate were taken from genotype 1a of HCV, but other genotypes, eg 2a, may be substituted with similar
- 35 results.

The DNA plasmids are introduced into cultured cells using electroporation, liposomes or other means. Synthesis of the protease and the substrate begin shortly after introduction and may be detected within a

5 few hours by immunological means. Therefore, test
compounds are added at desired concentrations to the
cells within a few minutes after introducing the
plasmids. The cells are then placed in a standard CO₂
incubator at 37°C, in tissue culture medium eg Dulbecco-
10 modified MEM containing 10% bovine serum. After 6-48
hours, the cells are collected by physically scraping
them from plastic dishes in which they have been
growing, centrifuging them and then lysing about 10⁶ of
the concentrated cells in a minimal volume of buffered
15 detergent, eg 20 µl of 1% sodium dodecyl sulfate in 0.10
M Tris-HCl, pH 6.5, containing 1% mercaptaethanol and 7%
glycerol. The samples are then loaded onto a standard
SDS polyacrylamide gel, the polypeptides separated by
electrophoresis, and the gel contents then
20 electroblotted onto nitrocellulose or other suitable
paper support, and the substrate and products detected
by decoration with specific antibodies.

Although this invention has been described with
respect to specific embodiments, the details of these
25 embodiments are not to be construed as limitations.
Various equivalents, changes and modifications may be

invention, and it is understood that such equivalent

Boc-Asp(O^tBu)-Glu(O^tBu)-Val-Val-Pro-boroAlg-pinanediol
was prepared by coupling the protected pentapeptide to
25 H-boroAlg-pinanediol. Boc-Asp(O^tBu)-Glu(O^tBu)-Val-Val-
Pro-OH (1.8 g, 2.3 mmol) was dissolved 10 mL THF and was
cooled to -20°C. Isobutyl chloroformate (0.30 mL, 2.3
mmol) and NMM (0.25 mL, 2.3 mmol) were added. After 5
minutes, this mixture was added to H-boroAlg-pinanediol
30 (0.67 g, 2.3 mmol) dissolved in THF (8 mL) at -20°C.
Cold THF (~5 mL) was used to aid in the transfer.
Triethylamine (0.32 mL, 2.3 mmol) was added and the
reaction mixture was allowed to come to room temperature
and to stir overnight. The mixture was filtered and
35 solvent was removed by evaporation. The residue was
dissolved in ethyl acetate, washed with 0.2 N HCl, 5%
NaHCO₃, and saturated NaCl. The organic phase was dried
with Na₂SO₄, filtered, and evaporated to yield a yellow
oil. Half of the crude product (1.5 g) was purified in

- 5 250 mg lots by HPLC using a 4 cm x 30 cm Rainin C-18 reverse phase column. A gradient from 60: 40 acetonitrile: water to 100% acetonitrile was run over a period of 28 minutes at a flow rate of 40 mL/min. The fractions containing the desired product were pooled and
10 lyophilized to yield a white solid (46 mg). ¹H-NMR (CD₃OD) δ 0.9-1.0 (m, 15H), 1.28 (s, 3H), 1.3 (s, 3H), 1.44 (3s, 27H), 1.6-2.8 (20H), 3.7(m, 1H), 3.9(m, 1H), 4.1-4.7 (7H), 5.05(m, 2H), 5.9(m, 1H). High res (ESI/MS) calculated for C₅₁H₈₆N₆O₁₃B₁ +H: 1001.635.

- Preparation of H-Asp-Glu-Val-Val-Pro-boroAlg pinanediol ester-trifluoroacetate: The hexapeptide analog, Boc-Asp(O^tBu)-Glu(O^tBu)-Val-Val-Pro-boroAlg-pinanediol,
20 (22.5 mg, 0.023 mmol) was treated with 2 mL of TFA: CH₂Cl₂ (1: 1) for 2 h. The material was concentrated in vacuo and purified by HPLC using C-18 Vydac reverse phase (2.2 x 25 cm) column with a gradient starting at 60:40 acetonitrile/water with 0.1%TFA going to 95:5 over
25 25 minutes with a flow rate of 8 mL/min. The product eluted at 80% acetonitrile. The fractions were evaporated and dried under high vacuum to give 8.9 mg (49%) of the desired product as white amorphous solid.
¹H-NMR (CD₃OD) δ 5.82 (m, 1H), 5.02 (m, 2H), 4.58(m,
30 1H), 4.42 (m, 3H), 4.18 (m, 4H), 3.90 (m, 1H), 3.62 (m, 1H), 3.01 (dd, 1H), 2.78 (m, 1H), 2.62 (m, 1H), 2.41-1.78 (m, 17H), 1.31 (s, 3H), 1.28 (s, 3H), 1.10 - 0.82 (m, 15H). ESI/MS calculated for C₃₈H₆₂N₆O₁₁B +H: 789.2.
